

## Chapter-2

### Functions

Page No.

9

Date: / /

clw

Function  $f: A \rightarrow B$  is a rule which associates each element of  $A$  with a unique element of  $B$ .

A function from a set  $A$  to a set  $B$  is a relation or rule that associates each element of  $A$  with a unique element of  $B$ .

$$\{(\alpha, \beta), (\alpha, \delta), (\alpha, \gamma), (\gamma, \beta)\} \subseteq A \times B$$

Domain

Let  $f: A \rightarrow B$ , if  $f$  is a function then the set of values of  $x$  which  $x \in A$  for which function is defined is said to be the domain and denoted by ' $D(f)$ '. Thus,

$$D(f) = \{x : x \in A \text{ for which function } f \text{ is defined}\}$$

Range  $\{x\}$  is said without a function  $f$ .

If a function  $f: A \rightarrow B$ , the set of values of  $y \in B$  corresponding to each  $x \in A$  which runs over the domain of the function is known as range of  $f$ .  $\{f(\alpha), f(\beta), f(\gamma)\} \subseteq B$

Types of functions

a. One to one or Injective functions

A function  $f$  from  $A$  to  $B$  i.e.  $f: A \rightarrow B$  is said to be one-to-one or injective if distinct element (pre image) in  $A$  have distinct image of  $B$ .

In symbol, for all  $(x, y) \in A$ ,  $\{x, y\} \subseteq A$

$$x \neq y \rightarrow f(x) \neq f(y)$$

$$f(x) = f(y) \rightarrow x = y$$

b. Onto function

A function  $f$  from a set  $A$  to set  $B$  i.e.  $f: A \rightarrow B$  is said to be onto or (sub)surjective, if every element of  $B$  is an image of at least one element of  $A$ .

### Exercise - 2.1

1. Let  $X = \{a, b, c\}$  and  $Y = \{p, q, s\}$ . Determine which of the following relations from  $X$  to  $Y$  are functions. Give reasons for your answers.

a.  $R_1 = \{(a, p), (a, q), (b, q), (c, s)\}$

Solution:

No, it is not a function as first two ordered pairs have the same domain element  $a$  but different range elements  $p$  and  $q$ .

b.  $R_2 = \{(a, p), (b, q)\}$

Solution:

No, it is not a function because,  $c \in X$  corresponds with no element of  $Y$ .

c.  $R_3 = \{(a, s), (b, s), (c, s)\}$

Solution:

Yes, it is a function because every element of  $X$  associates with a unique element of  $Y$ .

Domain:  $D(f) = \{a, b, c\}$  of  $A$  and Range:  $R(f) = \{s\}$  of  $B$ .

d.  $R_4 = \{(a, p), (b, p), (c, s)\}$

Solution:

Yes, it is a function because every element of  $X$  associates with a unique element of  $Y$ .

$D(f) = \{a, b, c\}$

$R(f) = \{p, s\}$

e.  $R_5 = \{(a, p), (b, q), (c, s)\}$

Solution:

Yes, it is a function because every element of  $X$  associates with unique element of  $Y$ .

$$D(f) = \{a, b, c\}$$

$$R(f) = \{p, q, s\}$$

$$0 < f(0) \leq (s) 7 \quad \text{and}$$

$$0 < f(1) \leq (s) 7$$

2. If  $f: A \rightarrow B$  where  $A$  and  $B \subset R$ , is defined by  $f(x) = 1-x$ , find the images of  $1, \frac{3}{2}, -1, 2 \in A$ .

Solution:

$$\text{We have, } f(x) = 1-x$$

Now,

$$f(1) = 1-1 = 0$$

~~$$f\left(\frac{3}{2}\right) = 1 - \frac{3}{2} = -\frac{1}{2} \text{ function is without } \frac{1}{2} \text{ in domain}$$~~

$$f(-1) = 1 - (-1) = 2$$

~~$$f(2) = 1 - 2 = -1 \text{ function is without } -1 \text{ in domain}$$~~

3. Let i)  $f(x) = x+2$  ii)  $f(x) = 2|x| + 3x$  in the interval  $-1 \leq x \leq 2$ . Find, b.  $f(-1), f(0), f(1), f(2)$  without odd & even part.

Solution:

~~$$f(x) = x+2 \quad \begin{cases} x > 0 \\ x < 0 \end{cases} \quad \begin{cases} x \geq 0 \\ x \leq 0 \end{cases} \quad \begin{cases} x \neq 0 \end{cases} \quad \text{function}$$~~

~~$$\text{When, } f(x) = x+2 \quad \begin{cases} x > 0 \\ x < 0 \end{cases} \quad \begin{cases} x \geq 0 \\ x \leq 0 \end{cases} \quad \begin{cases} x \neq 0 \end{cases} \quad \text{function}$$~~

a.  $f(-1) = -1+2 = 1$

b.  $f(0) = 0+2 = 2$

c.  $f(1) = 1+2 = 3$

d.  $f(2) = 2+2 = 4$

e.  $f(-2)$  = function is not define as  $-2 \notin$  domain definition

f.  $f(-3)$  = function not define as  $-3$  doesn't belong to domain definition.

ii.  $f(x) = 2|x| + 3x$

Solution:

~~$$f(-1) = 2|-1| + 3(-1) \quad \begin{cases} x > 0 \\ x < 0 \end{cases} \quad \begin{cases} x \geq 0 \\ x \leq 0 \end{cases} \quad \begin{cases} x \neq 0 \end{cases} \quad \text{function}$$~~

$$= 2 - 3$$

$$= -1 \quad \begin{cases} x > 0 \\ x < 0 \end{cases} \quad \begin{cases} x \geq 0 \\ x \leq 0 \end{cases} \quad \begin{cases} x \neq 0 \end{cases} \quad \text{function}$$

b.  $f(0) = 2|0| + 3 \times 0$

$= 0$

$f_{3,2,0} = (+) 0$

$f_{2,0,0} = (-) 0$

c.  $f(1) = 2|1| + 3 \times 1$  A point at  $x=1$  is  $(1, 5)$ .

A point at  $x=1$  is  $(1, 5)$  which is  $x=c = (c) 7$ .

d.  $f(2) = 2|2| + 3 \times 2$

$= 10$

$x=c = (c) 7$  mark ad

and

$0 = (c) = (c) 7$

e.  $f(-2)$  = function is not defined as  $-2$  doesn't belong to domain of definition.

$c = (-) - c = (c) 7$

f.  $f(3)$  = function is not defined as  $3$  doesn't belong to domain of definition.

4-i. Let the function  $f: R \rightarrow R$  be defined by  $x \geq 0 \geq 1$ .

$$f(x) = \begin{cases} 3+2x & \text{for } -\frac{1}{2} \leq x < 0 \\ 3-2x & \text{for } 0 \leq x < \frac{1}{2} \\ -3-2x & \text{for } x \geq \frac{1}{2} \end{cases}$$

Find;

a.  $f(-\frac{1}{2})$

Solution:

Since,  $-\frac{1}{2} \in [-\frac{1}{2}, 0)$  or  $-\frac{1}{2} \leq x < 0$ , we use the formula;

which is  $f(x) = 3+2x$  for  $x \in [-\frac{1}{2}, 0)$ .

$= 2$

mark ad

b.  $f(0)$

Solution:

Since,  $0 \in [0, \frac{1}{2})$  or  $0 \leq x < \frac{1}{2}$ , we use the formula

$f(x) = 3-2x$

Now,  $f(0) = 3-2 \times 0 = 3$

c.  $f(y_2)$

Solution:

Since,  $y_2 \in [\frac{1}{2}, \infty)$  or  $x \geq y_2$ , we use the formula

$$f(x) = -3 - 2x$$

$$\text{Now, } f(y_2) = -3 - 2 \times \frac{1}{2}$$

$$= -4$$

$$\frac{d}{h} [f(h) - f(0)] \text{ for } 0 \leq h < \frac{1}{2}$$

Solution:

Since, for  $0 \leq h < y_2$ , we use the formula

$$f(x) = -3 - 2x \quad (\text{for } x > 0 \text{ and } x < 1)$$

$$\text{Now, } \frac{d}{h} [f(h) - f(0)] = \frac{-3 - 2h - (-3)}{h}$$

$$= \frac{-2h}{h} = -2 \quad [\because f(0) = -3]$$

$$h$$

$$= -2 \quad (\text{from (c) } \Rightarrow \text{ (d)})$$

ii. Let the function  $f: \mathbb{R} \rightarrow \mathbb{R}$  be defined by  $f(x) = \begin{cases} 4x-2 & \text{for } x \geq 1 \\ 2x & \text{for } x < 1 \end{cases}$   
Find.

a.  $f(2)$

Solution:  $(\text{c) } f(2) = 6 \Rightarrow (\text{e) } f(2) = 6)$

Since,  $2 \in (\infty, 1]$  or  $x \geq 1$ , we use the formula

$$(s = \text{e) } f(2) = 4x-2 \quad (\text{from (c)})$$

$$\text{Now, } f(2) = 4 \times 2 - 2$$

$$= 6 \quad (\text{from (c)})$$

b.  $f(1)$

Solution:  $\cancel{\text{it}}$

Since  $1 \in (x \geq 1)$  we use the formula

$$f(x) = 4x-2$$

Now,  $f(2) = 4x1 - 2$

$= 2$

different diff. and min. s.t.  $x \in (\infty, 5^{\circ}] \cap [0, \infty)$

c.  $f(0)$

Solution:

Since,  $0 \in (x < 1)$  we use the formula

$f(x) = 2x$

Now,  $f(0) = 2 \times 0$

$= 0$

$\forall x > d > 0 \quad \text{and} \quad (0)^2 < (d)^2$

d.  $f(-1)$

Solution: different diff. b/w s.t.  $s^k \geq d > 0$  w.r.t.  $x$

Since,  $-1 \in (x < 1)$ , we use the formula

$f(x) = 2x_0^2 - ds - s = -(0)^2 - (d)^2$

Now,  $f(-1) = 2 \times (-1)^2$

$= -2^2 - ds - s = -4 - ds - s$

e.  $\frac{f(h) - f(1)}{h}$  for  $1 < h$

Solution: 2nd method of R.F. without diff. (c) i.e.

for  $1 < h$ , we use the formula

$f(x) = 4x - 2$

Now,  $f(h) - f(1) = 4h - 2 - f(1)$

different diff. b/w  $h$  and  $1 < x < h$  (1.s.t.)  $\exists s^k \in S$

$= 4h - 2 - 2 + [(0)^2 - f(1) = 2]$

$\therefore h \in S \times N \Rightarrow (s)^2$

$= \frac{4h - 4}{h}$

$= \frac{4(h-1)}{h}$

5. Let  $A = \{-1, 0, 2, 4, 6\}$  and a function  $f: A \rightarrow \mathbb{R}$  is defined by (i)  $y = f(x) = \frac{2x}{x+2}$  ii)  $y = f(x) = \frac{x(x+1)}{x+2}$

Find the range of  $f$ . (Ans)  $\{-1, 0, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}\}$

$$\text{i). } y = f(x) = \frac{x}{x+2}$$

Solution:

Given,  $f(x) = \frac{x}{x+2}$  and  $A = \{-1, 0, 2, 4, 6\}$

When  $x = \{-1, 0, 2, 4, 6\}$  the value of  $f(x)$  i.e.  $f(-1), f(0), f(2)$   
 $(f(4), f(6))$  are  $-1, 0, \frac{1}{2}, \frac{2}{3}$  and  $\frac{3}{4}$  respectively.

$\therefore$  range of  $f = \{f(-1), f(0), f(2), f(4), f(6)\}$

$$\therefore (f)(A) = \{-1, 0, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}\}$$

for ii)  $y = f(x) = \frac{x(x+1)}{x+2}$  for all  $x \in A$  but

without  $x = -2$  giving range to

Solution: For  $x \in \{-1, 0, 2, 4, 6\}$  the value of  $f(x)$

are  $0, \frac{3}{2}, \frac{10}{3}, \frac{21}{4}$  and  $21$   
*i.e.  $f(-1), f(0), f(2), f(4), f(6)$  are  $0, \frac{3}{2}, \frac{10}{3}, \frac{21}{4}$  and  $21$*

Now,

$$\text{Range, } R(f) = \left\{ 0, \frac{3}{2}, \frac{10}{3}, \frac{21}{4} \right\}$$

Q. Determine whether the functions  $f$  and  $g$  defined below are equal or not.

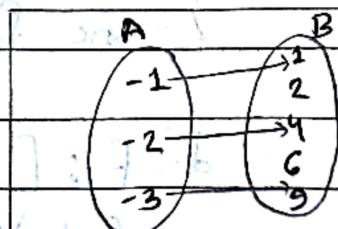

a.  $f(x) = x^2$  where  $A = \{x : x = -1, -2, -3\}$

b. Venn diagram.

Solution:

Here, Given function  $g(x) = \{(-1, 1), (-2, 4), (-3, 9)\}$

Also,

The function  $f$  is defined by;  $f(x) = x^2$  where  $A = \{-2, -1, -2, -3\}$

Now,

$$f(x) = \{(-1, 1), (-2, 4), (-3, 9)\}$$

Since,  $f(x) = g(x)$ . The functions are equal.

7. Determine whether or not each of the following functions are one to one.

a. Let  $A = \{-2, -1, 0, 1, 2\}$  and  $B = \{4, 0, 1\}$ . A function  $f : A \rightarrow B$  is defined by;

$$\begin{cases} f(-2) = 4 \\ f(-1) = 0 \\ f(0) = 0 \\ f(1) = 1 \\ f(2) = 4 \end{cases}$$

Solution: No, since  $-2 \neq 1$  but  $f(-2) = f(1) = 4$ .

No, since  $-2 \neq 2$  but  $f(-2) = f(2) = 4$ .

So  $f$  is not one to one.

b. Let  $A$  be the set of positive integers (and  $B$  the set of square of positive integers, A function

$f : A \rightarrow B$  is defined by  $f(x) = x^2$ .

Solution: Yes, since  $x_1 \neq x_2 \rightarrow f(x_1) \neq f(x_2)$ . So  $f$  is one to one function.

c.  $f : [-2, 2] \rightarrow \mathbb{R}$  is defined by  $f(x) = x^2$

Solution:

Since,  $2 \neq -2$  but  $f(-2) = f(2)$ , so  $f$  is not one to one function.

d.  $f : [0, 3] \rightarrow \mathbb{R}$  is defined by  $f(x) = x^2$

Solution:

Since,  $x_1 \neq x_2 \rightarrow f(x_1) \neq f(x_2)$ , so  $f$  is one to one function.

8. Examine whether the following functions are one to one, onto, both or neither.

i.  $f : A \rightarrow B$  defined by  $f(x) = x^2$  where,  $A = \{1, -3, 3\}$  and  $B = \{1, 9\}$

~~Solution:~~  $f(x) = x^2$  is not bijective as  $x \in A$   $\rightarrow x^2 \in B$

Here,  $f(x) = x^2$  then

$$f(1) = 1$$

$$f(-3) = 9 = f(3)$$

$$f(3) = 9$$

Since, All the elements on set B has pre-image on set A.

It is ~~onto~~ function.

ii.  $f : N \rightarrow N$  defined by  $f(x) = 2x$  ~~and  $x \neq 0$~~

~~Solution:~~

$$f(x) = 2x$$

Let  $x_1, x_2 \in N$

$$\text{then } f(x_1) = f(x_2) \rightarrow 2x_1 = 2x_2 \rightarrow x_1 = x_2$$

$\therefore f$  is one to one function

Also,

since all for all  $y \in N$ ,  $x \notin N$ ; so  $f$  is not onto function

iii.  $f : (-2, 2) \rightarrow R$  defined by  $f(x) = x^2$

~~Solution:~~

Here,  $f(x) = x^2$

$$f(-1) = 1$$

$$f(0) = 0$$

$$f(1) = 1$$

Since,  $(-1) \neq (1)$  but  $f(-1) = f(1)$ . It is not one to one function.

Again,

Let  $f(x) = y$  such that  $y \in R$  in  $\mathbb{R}$

$\rightarrow y = x^2$  without relation with other elements of set.

$\rightarrow x = \sqrt{y}$ , If  $y = -1$ , as  $y \in \mathbb{R}$  does not exist.

Then  $x$  will be undefined. Hence,  $f(x)$  is not onto.

Ans 1- function: A function  $f: A \rightarrow B$  is called bijective if  $f: A \rightarrow B$  is both one-to-one and onto.

iv.  $f: \mathbb{Q} \rightarrow \mathbb{Q}$  defined by  $f(x) = 6x + 5$

Solution:

Let  $x_1$  and  $x_2 \in \mathbb{Q}$  then,

$$\begin{aligned} f(x_1) = f(x_2) &\rightarrow 6x_1 + 5 = 6x_2 + 5 \quad (\text{LHS}) \\ &\rightarrow 6x_1 = 6x_2 \quad (\text{LHS}) - (\text{RHS}) \end{aligned}$$

$\therefore x_1 = x_2$  exists w.r.t H.A.  $\therefore f$  is one-to-one function.

Again,

Let  $y$  be any element  $\in \mathbb{Q}$  then,

$$f(x) = y = 6x + 5 \quad \text{with L.H.S.} \leftarrow \text{R.H.S.}$$

$$\text{or } y - 5 = 6x$$

$$\text{or, } \frac{y-5}{6} = x \quad \text{Hence, } x \in \mathbb{Q}$$

$$\text{or, } x = \frac{y-5}{6} \in \mathbb{Q} \quad \text{for all } y \in \mathbb{Q}$$

And,  $f\left(\frac{y-5}{6}\right) = 6\left(\frac{y-5}{6}\right) + 5 = y$

$\therefore y$  is the image of  $\frac{y-5}{6}$   $\therefore f$  is onto function.

v.  $f: \mathbb{R} \rightarrow \mathbb{R}$  defined by  $f(x) = x^3$

Solution:

Let  $x_1, x_2 \in \mathbb{R}$  then,  $f(x_1) \neq f(x_2)$  since

$$f(x_1) = f(x_2) \rightarrow (x_1)^3 = (x_2)^3 \quad \text{without any}$$

$$\rightarrow x_1 = x_2$$

$\therefore f$  is one-to-one function.

Again,

Let  $y$  be any element  $\in \mathbb{R}$  then,

$$f(x) = y = x^3$$

$$\text{or } y = x^3$$

$$\text{or, } y^{\frac{1}{3}} = x$$

Now, if  $x \in \mathbb{R}$  then  $y^{\frac{1}{3}} \in \mathbb{R}$  without any restriction.

Now,  $f(y^{\frac{1}{3}}) = (y^{\frac{1}{3}})^3$  is well defined.

Here,  $y$  is the image of  $y^{\frac{1}{3}}$ .

$\therefore f$  is onto function.

Q. Let a function  $f: A \rightarrow B$  be defined by  $f(x) = \frac{x^2}{6}$  with  $A = \{-2, -1, 0, 1, 2\}$  and  $B = \{0, \frac{1}{6}, \frac{2}{3}\}$ . Find the range of  $f$ . Is the function one to one and onto?

Solution:

$$\text{Here, } f(x) = \frac{x^2}{6}$$

$$f(-2) = \frac{(-2)^2}{6} = \frac{2}{3}$$

$$f(-1) = \frac{1}{6}$$

$$f(0) = 0$$

$$f(1) = \frac{1}{6}$$

$$\therefore f(2) = 2$$

Since,  $-2 \neq 2$  but  $f(-2) = f(2)$ . So, it is not one to one function.

Again,

Since all elements of set  $B$  has pre-image on set  $A$ . So,

it is onto function.

Also,

$$R(f) = \left\{ 0, \frac{2}{6}, \frac{2}{3} \right\}$$

b. Let a function  $f: A \rightarrow B$  be defined by  $f(x) = x^2 + 1$  with  $A = \{-1, 0, 1, 2, 3, 4\}$  and  $B = \{-1, 0, \frac{4}{5}, \frac{5}{7}, 1, 2, 3\}$ . Find the range of  $f$ . Is the function  $f$  one-to-one and onto both? If not, how can the function be made one-to-one and onto both?

Solution:

$$\text{Here, } A = \{-1, 0, 1, 2, 3, 4\}$$

$$f(x) = x^2 + 1 \quad \text{and} \quad 2x - 1$$

$$f(-1) = 0$$

~~$$f(0) = -1$$~~

~~$$f(1) = 2$$~~

~~$$f(2) = 1$$~~

~~$$f(3) = \frac{4}{5}$$~~

~~$$f(4) = \frac{5}{7}$$~~

Here,

$\forall x_1 \neq x_2 \rightarrow f(x_1) \neq f(x_2)$ . So, the function  $f$  is one-to-one function.

Again,

The element '3' in set  $B$  doesn't have pre-image in set  $A$ . So it is not onto function.

Also,  $(-1)^2 = (1)^2$ . And  $0 + 1 = 1$ .

$$R(f) = \{-1, 0, \frac{4}{5}, \frac{5}{7}, 1, 2\}$$
